People

Since the advent of the very first waterparks, wave pools and rivers have been an integral part of any facility indoor or out and are extremely popular for both bathers and operators alike and Aqua Leisure's engineers have been at the forefront of their development. Bathers enjoy either a relaxed and meandering ride around a park, the thrill of a high speed rapid river or the excitement of breaking waves, whilst the operators enjoy a simple, cost effective ride that has a high active capacity.

Products

Wave pools can be constructed as a standalone feature or incorporated into or linked to a much larger river system and are suitable for both indoor and outdoor parks. State of the art pneumatic wave machines offer a variety of wave types, from gentle swells to large breakers for typical designs or can be configured to provide river torrents.

Projects

While a majority of waterparks concentrate on flume rides and large areas of flat water, it is possible to add much greater depth to a park layout with the simple addition of multilevel pools linked by rivers, rapids, tube chutes, conveyors and the Master Blaster. These pools can provide both an attractive backdrop in the form of cascades or waterfalls, together with providing bathers with new perspectives of the park when swimming three meters above normal ground level.
